Institution Codes and Addresses

Most items in Mathematical Reviews (MR) and Current Mathematical Publications (CMP) include institution address codes. The institution code is used to abbreviate the address given by the author in the item (and in MR to indicate the reviewer location for some reviewers). The code consists of two [or three] parts separated by hyphens; these parts designate the country, the university or institution [and the department]. For six countries, the country designation consists of a single digit; these countries are 1- USA, 2- USSR, 3- Canada, 4- United Kingdom, 5- Australia and 6- India. The absence of a department code indicates the Department of Mathematics. For those instances in which the item gives either no department or a department for which there is no code, the Department of Mathematics is used as the default and the third part of the code is omitted. A code is assigned only when the item bears an address that coincides with one for which there is an existing code. While it is not feasible to code all institutions, frequent additions are made to the list of codes. Supplements to this list appear in issues of CMP, and a revised list is planned for the MR Annual Index for 1990. Sometimes an institution code is made invalid; in these cases the same institution will be assigned a different code and a cross-reference to the new code will be given. The phrase used for an actual entry will be: (Invalid; use X-XXX) added as a separate line between the old institution code and the first line of the address.

TRANSLITERATION OF CYRILLIC

The system for transliteration (romanization) of Cyrillic used in this index is given below in the column headed "MR (new)". It is the system that has been used in Mathematical Reviews since the beginning of 1983 and it is largely in agreement with other transliteration systems in use in the U.S.A., such as those of the American National Standards Institute (ANSI), the U.S. Library of Congress (LC), and the Institute for Scientific Information (ISI). The principal feature of these systems is that they are intended to be as phonetic as possible for speakers of English.

The table below lists all Cyrillic letters occurring in Slavic languages, and the transliteration schemes used by:

Mathematical Reviews since 1983 = MR (new),
MR before 1983 and Zentralblatt für Mathematik (Zbl) before 1980 = old (MR, Zbl),
Zbl since 1980 = Zbl (new),
American National Standards Institute = ANSI,
U.S. Library of Congress = LC,
Institute for Scientific Information = ISI.

The transliteration of the British Standards Institute (BSI) agrees with that of ISI, except for the letters ё and й ↦ ĭ.

In the schemes of some of these enterprises, a few Cyrillic letters receive more than one transliteration, depending on the language in which the letter occurs. Non-Russian Cyrillic letters and transliterations different from the one for Russian are identified by superscript numbers:

1 Ukrainian
2 Belorussian
3 Serbian
4 Macedonian
5 Bulgarian.

In order to achieve complete reversibility of the transliteration scheme, centered dots are used as a separating or bracketing device in the following cases: тс↦t·s, тш↦t·sh, шч↦sh·ch, ыу↦y·u, ыа↦y·a, дj↦d·j, лj↦l·j, нj↦n·j, for separation, and ц↦ dzh· for bracketing.

Alphabetization (in indexes, etc.) takes place following the "stripped" version (i.e., without diacritical marks) of the transliteration; the symbol ″ (double prime) representing ъ is kept in the stripped version and placed at the head of the alphabet (the single prime representing ь is ignored). The capital version of the Bulgarian ″ is distinguished by an underbar: ″̲.
